

# PVA Virus Scan Integration Module For OpenText Livelink 9.7.x through Content Server 16.x

## KEEP VIRUSES OUT OF YOUR REPOSITORY

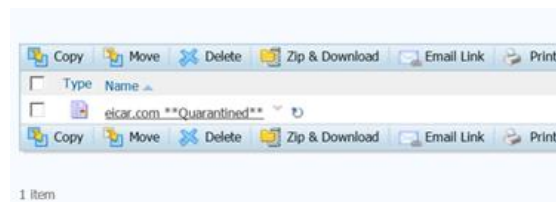

How are you protecting your repository from viruses? With the proliferation of mobile devices and extranets accessing the network, the risk of viruses being introduced into applications or repositories such as **OpenText Content Server** and **Livelink** has greatly increased.

The **PVA Virus Scan Integration Module (Virus Scan)** uses the command line function of your system's anti-virus software to protect your **Content Server** or **Livelink** repository.

**Virus Scan** provides real-time detection and blocking of infected documents. It prevents the file upload and informs the user about the infected file. **Virus Scan** can also scan the existing files in the repository, and will quarantine any infected files it finds. Batch scanning can be scheduled during off-hours to minimize interference with regular operations.

Real-time blocking

Batch scan quarantine

**Virus Scan** can capture and scan documents in real time, uploaded by:

Add Document, Drag-and-Drop (WebDAV, HTML5), Enterprise Connect, Tempo Box, workflow attachment

**Virus Scan** works with any anti-virus software that supports command-line scanning (including but not limited to):

- AVG Antivirus for Windows
- Computer Associates eTrust AntiVirus for Windows
- McAfee for Windows and UNIX
- Norman for Windows
- Sophos for Windows
- TrendMicro System Cleaner for Windows
- TrendMicro Office Scan for Windows
- Kaspersky Antivirus for Windows
- Symantec Endpoint Protection for Windows

"I enjoyed watching the PVA Virus Scan module continually protecting my Livelink server. It was easy to setup, monitor, configure, and maintain."

Jerry Kollars,  
Livelink System Administrator  
National Institutes of Health

### Virus Scan

- Blocks the upload of documents with viruses
- Scans your system for infected documents
- Quarantines infected files
